GREEN CONCRETE
PRODUCT No. 1101-63

PRODUCT DESCRIPTION
QUIKRETE® Green Concrete Mix is a 3500 psi (24.2 MPa) blend of recycled aggregate, sand, fly ash and Portland cement, containing a minimum of 50% recycled material.

PRODUCT USE
QUIKRETE® Green Concrete Mix has a unique formulation, offering benefits such as:

- Greater than 50% Recycled Content
- Meets ASTM C387 requirements
- Green design
- Contributes to US Green Building Council LEED points

SIZES
- QUIKRETE® Green Concrete Mix - 60 lb. (27.2 kg)

YIELD
- Each 60 lb. (27.2 kg) bag of QUIKRETE® Green Concrete Mix will yield approximately 0.45 ft³ (12.7L) of mixed concrete.

TECHNICAL DATA
QUIKRETE® Green Concrete Mix exceeds the performance requirements of ASTM C387, “Standard Specification for Packaged, Dry, Combined Materials for Mortar and Concrete.” A properly handled mix will exceed 3,500 psi (24.2 MPa) in 28 days.

APPLICATION
Sidewalks and patios should be at least 4” thick. For straight sides, construct the forms out of 2x4’s. For curves use ¼” plywood and stakes. Dampen the sub-grade before concrete is placed. Do not leave standing puddles. Mix the concrete and shovel into the form. After concrete has been compacted and spread to completely fill the forms without air pockets, strike off and float immediately. To strike off, use a straight board (screed), moving the edge back and forth with a saw-like motion to smooth the surface. Use a darby or bull float to float the surface; this levels any ridges and fills voids left by the straight edge. Cut the concrete away from the forms by running an edging tool or trowel along the forms to compact the slab edges. Cut 1” (25.4 mm) deep control joints into the slab every 6’ - 8’ (1.8 - 2.4 m) using a grooving tool. Allow concrete to stiffen slightly, waiting until all water has evaporated from the surface before troweling or applying a broom finish. Note - For best results, do not overwork the material.

FINISHING
Any standard concrete finishing technique is acceptable for use with QUIKRETE® Green Concrete Mix. Concrete can be hand troweled, power troweled, broom finished or finished with other specialty finishes.

CURING
Proper curing increases the strength and durability of concrete. QUIKRETE® Concrete Cure & Seal– Satin Finish (#8730) provides the easiest and most convenient method of curing. Apply by spray, brush or roller soon after the final finishing operation when the surface is hard. The surface may be damp, but not wet, when applying curing compound. Complete coverage is essential. Alternately, freshly placed concrete can be moist-cured by covering the surface with plastic sheeting or by keeping the surface wet with a lawn sprinkler. Curing should be started as soon as possible and should continue for
a period of 5 days in warm weather at 70°F (21°C) or higher or 7 days in colder weather at 50-70°F (10-21°C). Water curing with lawn sprinklers, nozzles or soaking hoses must be continuous to prevent interruption of the curing process. If plastic sheets are used they must be laid flat, thoroughly sealed at joints and anchored carefully along edges.

**PRECAUTIONS**

- Curing compounds should not be applied if rain or temperatures below 50°F (10°C) are expected within 24 hours. Curing with plastic or burlap can cause patchy discoloration in colored concrete. For colored concrete, wet curing or the use of QUIKRETE® Concrete Cure & Seal – Satin Finish is recommended

- Do not use curing compounds during late fall on surfaces where deicers will be used to melt ice and snow. Using curing compounds at that time may prevent proper air drying of the concrete, which is necessary to enhance its resistance to damage caused by deicers.
- Protect concrete from freezing during the first 48 hours. Plastic sheeting and insulation blankets should be used if temperatures are expected to fall below 32°F (0°C).

**WARRANTY**
